There are certainly faults in the homeworks (and several solutions that could have been obtained much more directly); but in general, I have tried to correct any any mistakes noticed by the grader. The assignments were rather creative (and difficult) and generally did not come out of the course textbook, Ashcroft and Mermin's Solid State Physics.

Fig. 2 shows the energy distributions of the electrons belonging to a correlated pair excited in the scattering of the incident electron with 25 eV energy on valence electrons with an energy from 0 to 2 eV below the Fermi level. Fig. 2A and B corresponds to the clean $W(1\ 1\ 0)$ surface and two values of the incidence angle of the incident beam: incidence angles equal to $\pm 12^\circ$.

In this paper, we investigate thermoelastic dissipation (TED) in systems whose thermal response is characterized by multiple time constants. Zener [Phys. Rev. 52, 230 (1937)] analyzed TED in a cantilever with the assumption that heat transfer is one dimensional. He showed that a single thermal mode was dominant and arrived at a formula for quantifying the quality factor of a resonating cantilever.
